ABSTRACT:

PROBLEM TO BE SOLVED: To free a user from uncomfortable feeling due to sudden ringer tone with large volume when the user is near a communication device.

SOLUTION: This communication device is provided with an opening/closing detecting means for detecting the opening/closing of a case, a speaker for outputting ringer tone, a control means, and a vibrator for vibrating the case. If it is judged that the opening/closing detecting means detects that the case is opened at the time of receiving an incoming call, the control means prohibits the speaker to output ringer tone and drives the vibrator even if the speaker is set so as to output ringer tone at the time of receiving an incoming call.
